

Intégration à git

Pour interfacer `phystool` à `git`, il suffit de créer un répertoire vide sur BitBucket (ou autre plateforme similaire) et de copier l'url dans le champ de configuration proposé dans le menu `Git → Configure`.

If the database is already managed by `git` (i.e. the database's directory contains a `‘.git’` directory), no automatic action will be performed.

Otherwise, the program will automatically attempt to initialise a new `git` repository. The remote repository can be set interactively but, to ensure that nothing is overwritten, it must be totally empty during for the initialization process to succeed.
